TITLE: Contribution to the problem of types of vector coupling in a $p^2\ell$ configuration		
SOURCE: AN Lit SSR. Litovskiy fizicheskiy sbornik, v.1, no.1-2, 1961, 33-37		
TOPIC TAGS: vector coupling, configuration $p^2\ell$ , matrix elements, energy operator, spin-orbit interaction, electrostatic interaction, O, N, oxygen energy level, nitrogen energy level		
ABSTRACT: This theoretical paper is a further development of a paper by the same authors in Akad. nauk LitSSR, Trudy, B, v. 2(25), 1961, 53, in which an examination of the problem of the types of vector coupling for a configuration $p^2\ell$ permitted them to make certain conclusions on the regularities prevailing in the change of type of coupling following an increase in the degree of excitation. The present paper develops expressions for the diagonal and nondiagonal matrix elements of the energy operator of the spin-orbit interaction in the case of LS coupling and for the diagonal matrix elements of the energy operator of electrostatic and spin-orbit interaction in the case of $LS_0$ and $J_1$ coupling. The question of just what types of vector coupling prevail in specific examples is

examined in the case of O II and N I atoms with reference to the configuration

$1s^2 2s^2 2p^2 4f$ . The arrangement of the energy levels is compared for the experimental and for the  $LS_0$  and the  $J_0 1$  theoretical cases. A comparison of the experimental and theoretical data in the case of O II permits the conclusion that the  $LS_0$  and  $J_0 1$  couplings are equally suitable in the  $2p^2 4f$  configuration. In the transition to N I the  $LS$  coupling is not suitable. It is possible that with the decrease in Z the transition to nonhomogeneous coupling occurs at lower degrees of excitation. Orig. art. has 4 formulas and 2 figures.

TITLE: Calculation of matrix elements of the energy operator in the case of a single electron outside a partially filled shell

SOURCE: Akademiya nauk Litovskoy SSR. Trudy. Seriya B, no. 1(28), 1962, 3-15

TEXT: The authors refer to their previous paper (Trudy AN Litovskoy SSR, B 4(27), 59, 1961) where general expressions were derived for the matrix element of a single electron outside a shell. If the shell is almost completely filled, these expressions can be simplified by making use of the properties of the operators of complementary shells (the configuration  $l^{4l+2-N}$  and  $1^N$ ). The operator of electrostatic interaction energy is discussed and general expressions are obtained for the coefficients of radial integrals of electrostatic interaction of exchange type, for the four kinds of coupling  $LS$ ,  $J_{0l}$ ,  $LS_0$  and  $J_{0j}$ . These coefficients are computed for a

Calculation of matrix elements ...

$p^4_1$  configuration with  $LS_{\text{o}}$  coupling. Energy levels of Ne II in the  $ls^2 2s^2 2p^4 4f$  configuration, computed by the authors for  $J_{\text{o}}1$  and  $LS_{\text{o}}$  coupling, are compared in a diagram with the experimental levels. It is concluded that the  $J_{\text{o}}1$  coupling can be used for classification of the levels, while the  $LS_{\text{o}}$  coupling is useless. There are 1 figure and 1 table.

TITLE: Calculating the matrix elements of the energy operator in the case of one electron outside of an unfilled shell and for different types of coupling

PERIODICAL: Referativnyy zhurnal, Fizika, no. 7, 1962, 18, abstract 7A173 ("Tr. AN LitSSR", 1961, v. B, 4 (27), 59 - 72; Lith. summary)

TEXT: It is assumed that L-S coupling takes place in an unfilled shell, and that the resulting moments of this shell add vectorially to the moments of the outer electron in different types of coupling. The wave function is expressed by a linear combination of functions of the coupled moments. Expressions are given for the transformation matrices allowing for both the transition from the L-S coupling to other types and the coordinates interchange. Formulas are obtained for the matrix elements of electrostatic and spin-orbital interaction operators in different types of coupling.

TITLE: The problem of the classification of the energy spectrum of atoms in the  $2p^N$  configuration

SOURCE: AN LitSSR. Litovskiy fizicheskii sbornik, v. 3, no. 1-2, 1963, 155-158

TOPIC TAGS: energy spectrum,  
electron shell

energy spectrum classification,

ABSTRACT: The structure of the energy spectrum of the  $2p^N$  configuration for various degrees of shell filling and various levels of excitation of the outer electron is fully explored in the existing literature. In the present paper, the authors review some of the results of these theoretical investigations of the energy spectrum of N, O, F and Ne. When the excitation of the outer electron is increased, the LS-bond becomes invalid and the  $LS_0$ -bond and  $J_{0l}$ -bond appear instead (sequential structure bonds). These bonds appear at lower excitation levels when the number of electrons in the closed shell is large. For atoms with the same ionization level, the sequential structure bonds appear at lower excitation levels of the outer electron in the atom with lower N (or Z). When two atoms have

Card

1/2

ACCESSION NR: AT4041507

the same Z, the sequential structure bonds appear at low levels of outer electron excitation when N is large (ionization level small). When two atoms have the same number of electrons in the partially filled shell, the sequential structure bonds appear at low levels of outer electron excitation when the nucleus charge is small. Orig. art. has: 1 table.

TITLE: Approximate method of determining forced oscillations described by certain nonlinear differential equations.

SOURCE: AN UkrSSR. Dopovidi, no. 3, 1966, 286-291

TOPIC TAGS: nonlinear differential equation, oscillation, approximate solution, harmonic oscillation

ABSTRACT: This is a continuation of earlier work by the authors (Izv. vyssh. uch. zaved. elektromekhanika No. 1, 3, 1965), where an approximate method was developed for obtaining nonlinear differential equations (or systems of linear differential equations with nonlinear coefficients) describing forced oscillations. The present article is devoted to an analysis of the solutions obtained there with an aim at determining the accuracy of the equation. The particular differential equation analyzed is

$$L \frac{d^2q}{dt^2} + r \frac{dq}{dt} + \frac{q}{C} + \beta f(q, \dot{q}) = u, \quad (1)$$

where  $r$ ,  $L$ , and  $C$  are constant coefficients,  $u$  a specified sinusoidal function of the time ( $u = U_m \sin(\omega t) + \alpha$ ), and  $f$  is a power function of  $q$  and  $\dot{q}$ , and possibly of higher

Card 1/2

L 26593-66

ACC NR: AP60 1413

O

order derivatives;  $\beta$  is a small parameter. It is proved that by adding to the sinusoidal solution  $q = q_0 \sin(\omega t)$  a higher harmonic, it is possible to choose the amplitude of this harmonic in such a way that a harmonic of the same order occurs in the expansion of the specified function of the time. At this amplitude all the higher harmonics vanish with accuracy  $\beta^2$ . The limits of applicability of this method are discussed. This report was presented by Academician of AN UkrSSR Yu. G. Mytropol's'kyy (Yu. A. Mitropol'skiy). Orig. art. has: 15 formulas.

SOURCE: AN BSSR. Izvestiya. Seriya fiziko-tehnicheskikh nauk,  
no. 1, 1965, 44-51

TOPIC TAGS: radioactive isotope, tracer study, quality control

ABSTRACT: The author reports that since the first use of radioactive isotopes in the industry of BSSR in 1959, more than 350 radioisotope installations of various types have been installed, and the estimated economic gain from their use exceeds 750,000 rubles annually. Radioisotopes are used to greatest effect in the regulation of drying machinery, for which several control systems were developed in the laboratory for the use of isotopes and nuclear radiation of the Institute of Heat and Mass Exchange AN BSSR and

tested in the textile and structural-material industries. By way of examples, the block diagram for the control of drying machinery for fibers and the control of a grinding wheel in automatic grinding machines, the control of the dimensions of the shaft during the grinding process, and remote batching of aggressive, toxic, and explosive media with a radioisotope flow meter are described. Systems are under development also for radioisotope methods for sampling control of the thickness of the coating film on leather. In all cases the control accuracy was deemed satisfactory. TITLE: Some problems of the dynamics of combined servomechanisms of machines with program control				
SOURCE: Avtomatyka, no. 3, 1965, 19-26				
TOPIC TAGS: servomechanism, digital system				
ABSTRACT: Transient responses in combined servomechanisms designed for machines with digital program control are considered. These responses occur at the moment of passing of conjugate points of the interpolated section of a trajectory as a result of the impossibility of organizing infinitely large control signals required to satisfy the invariance conditions. Analytical dependences are established which couple the maximum dynamic error with servo drive parameters, the geometry of the loop, and the kinematics of motion. It is also possible to consider first all aspects of the control process (technical requirements of reproduction quality, geometry of the loop, dynamics of the actuating mechanism) on a universal computer which prepares the program for machine lathes with program control. SOURCE: Inzhenerno-fizicheskiy zhurnal, no. 4, 1964, 3-7

TOPIC TAGS: Surface nonisothermality, heat exchange, longitudinal flow, laminar boundary layer, turbulent boundary layer, laminar flow, turbulent flow, heat transfer

ABSTRACT: The heat exchange between a nonisothermal plate and a flow of air, water, and transformer oil with a laminar and turbulent boundary was studied experimentally in the range of  $Re$  numbers ranging from 10 to  $3 \times 10^7$ . Criterial equations were derived for calculating the heat exchange between a plate and a laminar and turbulent boundary layer. It was found that in the case of a laminar boundary layer, the initial unheated segment of the plate has a substantial effect on the heat transfer. The nonisothermality of the surface has an appreciable effect on the rate of the heat exchange. Orig. art. has: 3 figures, 7 formulas, and 2 tables.

AUTHORS: Zhukauskas, A. A., Zhyugzhda, I. I.

TITLE: Experimental study of heat transfer from a longitudinally streamlined plate in a laminar boundary layer

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, v. 4, no. 11, 1961, 105 - 108

TEXT: Flow criteria obtained by M. A. Mikheyev (Sb. "Konvektivnyy i luchistyy teploobmen". Izd. AN SSSR, M., 1960) and other authors have so far not found any experimental proof for a wide range of Prandtl's number. Specifically, this refers to viscous liquids. For this reason, the authors carried out experiments in this field. They used two closed circuits, the one conveying water and air, the other transformer oil. A detailed description of this arrangement is given in a paper by A. B. Ambrazyavichus and A. A. Zhukauskas (Trudy AN LitSSR, B. 4(16), 172, 1958). Two nickel-silicon plates (10.25 by 40 by 0.65 and 50.25 by 40 by 0.65 mm), with front edges rounded off, were used as test objects. Temperature on the upper and lower walls of the plates was measured by means of two copper-constantan thermocouples. The temperature field of the plates was kept

3108/B138

uniform. Heat losses at the ends were checked. The plates were heated by direct current. It was found that the velocity field, as determined by means of a thermistor probe, failed to be uniform only in the transformer oil at temperatures between 10 and 30°C and low flow velocities  $w < 0.2$  m/sec. The temperature of the liquid was varied from 10.5 to 60°C, and that of the plate wall from 30 to 103°C, flow velocity ranged from 0.02 to 2.0 m/sec, the Prandtl's number from 0.7 to 580, and the Reynolds number from 1 to  $3.3 \cdot 10^4$ . A flow criterion of the type

$Nu = f(Re^m, Pr^n)$  was to be determined. The authors finally found

$Nu_f = 0.70 Re_f^{0.5} Pr_f^{0.36} [Pr_f/Pr_w]^{0.25}$  where the subscripts f and w refer to the temperatures in the flow and in the wall, respectively. This formula renders the true processes very well. There are 2 figures and 11 references: 6 Soviet and 5 non-Soviet. The three most recent references to English-language publications read as follows: Hara T. Trans. Japan Soc. Mech. Engrs., 20, no. 92, 1954; Ede A. J. and Saunders O. A. Proc. Inst. Mech. Engrs., 172, 26, 1958; Wan der Hegge Zijnen. App. Sci. Res., A, 6, 2-3, 1956.

TITLE:

Calculation of heat loss of curved surfaces  
in the case of laminar boundary layer

SOURCE:

Akademiya nauk Litovskoy SSR, Trudy. Seriya  
B, no. 3, 1962, 191 - 201

TEXT: The heat loss coefficient is determined for  
a wedgeshaped body, introducing the angle coefficient  $\beta = 2\sigma/\alpha + 1$   
( $\sigma$  being Euler's number) and assuming a temperature distribution  
 $T_0 x^\beta$ . The results are:

$$\alpha(x)_{\theta=0} = \frac{4}{3} \alpha(x)_{\theta=0} \cdot \theta \frac{\Gamma(84/3) \Gamma(2/3)}{\Gamma(84/3 + 2/3)} \quad (15)$$

and

Cart: 1/3

Calculation of heat loss ..

S/236/62/000/003/004/004  
D234/D308

$$\alpha(x)_{\delta=1} = \frac{2}{3} \alpha(x)_{\delta=0} \cdot \frac{\Gamma(\delta + 2/3) \Gamma(2/3)}{\Gamma(\delta - 2/3 + 2/3)} \quad (16)$$

For bodies of arbitrary shape with constant temperature of the wall

$$Nu_x = 0.332 \chi(\delta) Re_x^{0.5} Pr^{0.333} + 0.067\beta - 0.026\beta^2 \quad (30)$$

With an accuracy of  $\pm 3\%$ , and if the surface temperature changes exponentially,

$$Nu_x = 0.332 \chi(\delta, \theta) Re_x^{0.5} Pr^{0.333} + 0.067\beta - 0.026\beta^2 \quad (33)$$

$\chi(\delta)$  is called the dynamical restoration coefficient,  $\chi(\delta, \theta)$  the universal restoration coefficient; both are plotted. The results are found to agree with experiments carried out by the authors on a plate in longitudinal flow. There are 5 figures

AUTHOR: Zhyugzhda, I. I. and Zhukauskas, A. A.

TITLE: Experimental investigation of local heat evolution in the intake section between two parallel plates

SOURCE Akademiya nauk Litovskoy SSR. Trudy. Seriya B. no. 1, 1963, 117-124

TEXT: The authors give a survey of experimental and theoretical investigations of heat evolution in an intake section in the case of two parallel plates and in a circular pipe. The method of incomplete modeling was used to investigate local and mean heat evolution between two parallel plates of length 22 mm. A constant thermal flow was used, and the distances between the plates in different experiments were 50, 20, 10 and 4 mm. The fluids used were air, water and transformer oil where, in the usual terminology,  $R_0$  varied from 5 to  $1.2 \times 10^5$   $Re_f$  from 14 to  $3.8 \times 10^3$ ,  $Pr_j$  from 0.7 to 580. The full characteristics of the flows are

Card 1/1

Experimental investigation of ...

S/236/63/000/001/008/015  
D251/D306

presented in tabular forms, and the criterial equations

$$\text{Nu}_{fx} = 0.95 \text{Re}_{fx}^{0.5} \text{Pr}_f^{0.33} [x/s \text{Re}_{fs}]^{0.1} [\text{Pr}_f/\text{Pr}_w]^{0.25} \quad (2)$$

$$\text{Nu}_{fl} = 1.35 \text{Re}_{fl}^{0.5} \text{Pr}_f^{0.33} [l/s \text{Re}_{fs}]^{0.1} [\text{Pr}_f/\text{Pr}_w]^{0.25} \quad (3)$$

are established for the local and mean heat-emission respectively. The distance from the beginning of the intake is used as the defining dimension in the criterial equation in the local case and the length of the tube in the local case. The temperature of the plates varied exponentially. Comparison with the formulas of other authors gave deviations from +8 to -20% in the results. The formation of boundary layers in the intake part of a channel, and the effect of the pressure gradient of velocity on these layers is

Card 2/3

Experimental investigation of ... S/235/63/000/001/008/015  
shown (increase of these factors reduced the boundary layers). The  
parameter  $(x/sRe_{js})^{0.1}$ , where s is the distance between the plates  
and x the characteristic dimension is used to take into account the  
effect on local evolution of heat in the intake part. There are 4  
figures and 1 table.
